TRY TO MAKE A FACE FOR EACH OF THE FOLLOWING: SADNESS, ANGER, JOY, FEAR, DISGUST AND SURPRISE

DOES FACIAL HAIR MAKE IT MORE DIFFICULT FOR THE APP TO RECOGNIZE AN EMOTION?

Facial hair may make it a little harder to read some parts of the face, but the app can still try to detect the person's emotion. The result may not always be correct/appropriate.

Kent

WHAT ETHICAL ISSUES DOES FACIAL RECOGNITION RAISE? HAS THE APP PROVIDED SUFFICIENT INFORMATION AS TO WHAT IT DOES WITH THE PHOTOS TAKEN OF PEOPLE'S FACES?

The main issues are privacy and permission. People should know if their face is being scanned and how their photos or face data are used. The app's listing also says it may collect some usage information and identifiers. Also the app can't recognize a person's age or race, but it can make a judgment based on the person's facial expression. For example, it may say that someone looks happy, sad, angry, or surprised. However, the result may not always be correct because we cannot always know what a person is truly feeling just by looking at their face. Therefore, the app should be used carefully and should not be used to judge or label people.

Julio

HOW WELL WOULD THE RECOGNITION SOFTWARE WORK WHEN USED IN A MORE NATURAL SETTING WHERE THE USER IS NOT MAKING A FACE FOR THE CAMERA?

The app usually recognize a face expression or emotion as neutral if the user does not make any face or show no emotion.

RESH

IN WHAT AREA OR CONDITION CAN WE USE THE APP FOR?

Emotion detection apps try to guess how someone feels by reading their face, voice, or body signals, and people use them for things like mental health check-ins, testing reactions to ads, helping call centers spot upset customers, checking if students are engaged, warning sleepy drivers, and supporting some autistic people in reading emotions. However, many scientists doubt how accurate these apps really are, since the same feeling can look different on different people and faces don't always show what's truly happening inside. Because of this, they work best as a helper for human judgment rather than a final decision-maker, and it matters a lot whether people know and agree to being monitored this way.
