DATA GATHERING

Presented By: GTKY CREATIVES

BSIT 2021

Spotify®

Spotify

Spotify is a popular digital audio streaming service that gives you on-demand access to millions of songs, podcasts, and audiobooks.

A. Clarify the basic goal of Improving the product

Upon trying the app, the group suggests improving some, if not most, of the Spotify features, especially the "home screen," which feels cluttered and makes it hard to find the music you want.

B. Discuss any issues that might create challenges for redesigning or creating a new product of Spotify

Aside from being an already established app with millions of downloads and subscribers worldwide, Spotify is owned and maintained by Spotify AB. Therefore, it might be illegal to modify or create an unauthorized version of the app.

Also, existing users who are already accustomed to the current version of Spotify might not be able to adjust easily to some of the improvements by the group, and might cause confusion.

C. Explain how you would use of each of the 3 data gathering techniques:

Interview

The group may interview each respondent about their experiences and difficulties with the cluttered home screen, such as finding their own music among podcasts, audiobooks, and recommendations.

Questionnaire

Using questionnaires, it will be easier for the researchers to collect data that can be computed to further improve the app, in terms of satisfaction and user complaints.

Observation

The group may observe respondents as they use Spotify to figure out what feature may cause an issue to their overall experience of finding and playing music on the home screen.

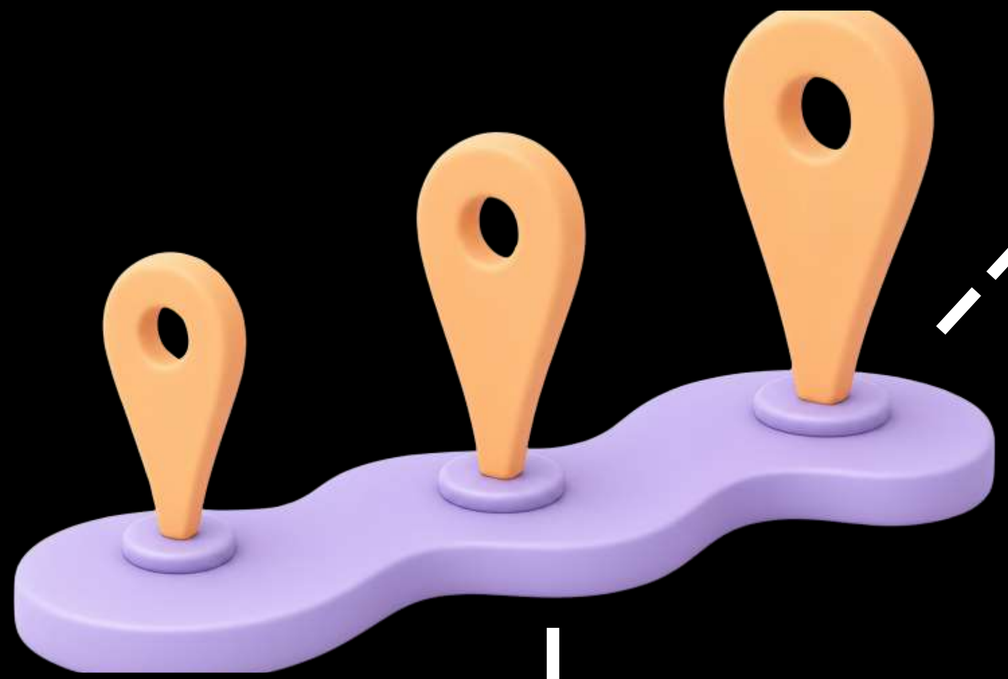

D. Consider your relationship with the user group and decide if an informed consent form is required.

The group has decided to ask groupmates and classmates to act as respondents for the study.

Before conducting any data gathering procedure, the group has decided to create a consent form which will be accomplished by each of the respondents, to ensure that all of them are willing to participate in the study without being biased.

E. Plan your Data Gathering

The group has decided to form a "focus group" which consists of the group members, wherein the leader is the interviewer, and the members are the interviewees. The group will record everything through a video recording.

The group decided to use an indirect method in carrying out the observation. It will be recorded as an audio recording, and will be transcribed by the group.

The group has decided that the questionnaires will mostly contain polar (yes/no) questions, and at most, two open-ended questions to collect an ample amount of data.

Interview

Online interview via Teams with Leader as Interviewer and members as Respondents

1.What do you usually open Spotify to do?

2.Walk me through what you do first when you open the home screen.

3.Which sections on the home screen do you use, and which do you ignore?

4.How do you feel about podcasts, audiobooks, and recommended mixes on the home screen?

5.Have you had trouble finding your own playlist or a saved song from the home screen?

6.If you could remove or rearrange one thing on the home screen, what would it be?

Survey

Answered by groupmates and members family members

1.What do you usually open Spotify to do?

2.Walk me through what you do first when you open the home screen.

3.Which sections on the home screen do you use, and which do you ignore?

4.How do you feel about podcasts, audiobooks, and recommended mixes on the home screen?

5.Have you had trouble finding your own playlist or a saved song from the home screen?

6.If you could remove or rearrange one thing on the home screen, what would it be?

Observation

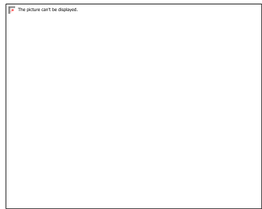

Indirect, with the observers as outsiders. Participants use their own phones while their voice is recorded, and the group takes notes and transcribes it later. Observers do not join in or help.

1.Open the app and find a playlist you made

2.Find the last song you played

3.Find a podcast, then get back to your music

4.Say out loud what you notice on the home screen.

F. Carry out the student, but limit its scope

To carry out the study, the group provided questionnaires and employed indirect observation. The group leader provided questions, whilst interviewees are given time to answer. The group will then use the data gathered to improve the Spotify home screen further.

Questions:

1. Have you used Spotify to listen to music?

1. Do you find Spotify's home screen confusing and messy?

1. Is it hard to find the music you want on the home screen?

1. Do podcasts, audiobooks, or videos on the home screen get in your way?

1. Do you scroll past content you don't care about before finding what you want?

1. Would you recommend the app to your friends or family?

F. Carry out the student, but limit its scope

To carry out the study, the group provided questionnaires and employed indirect observation. The group leader provided questions, whilst interviewees are given time to answer. The group will then use the data gathered to improve the Spotify home screen further.

Open-ended Questions:

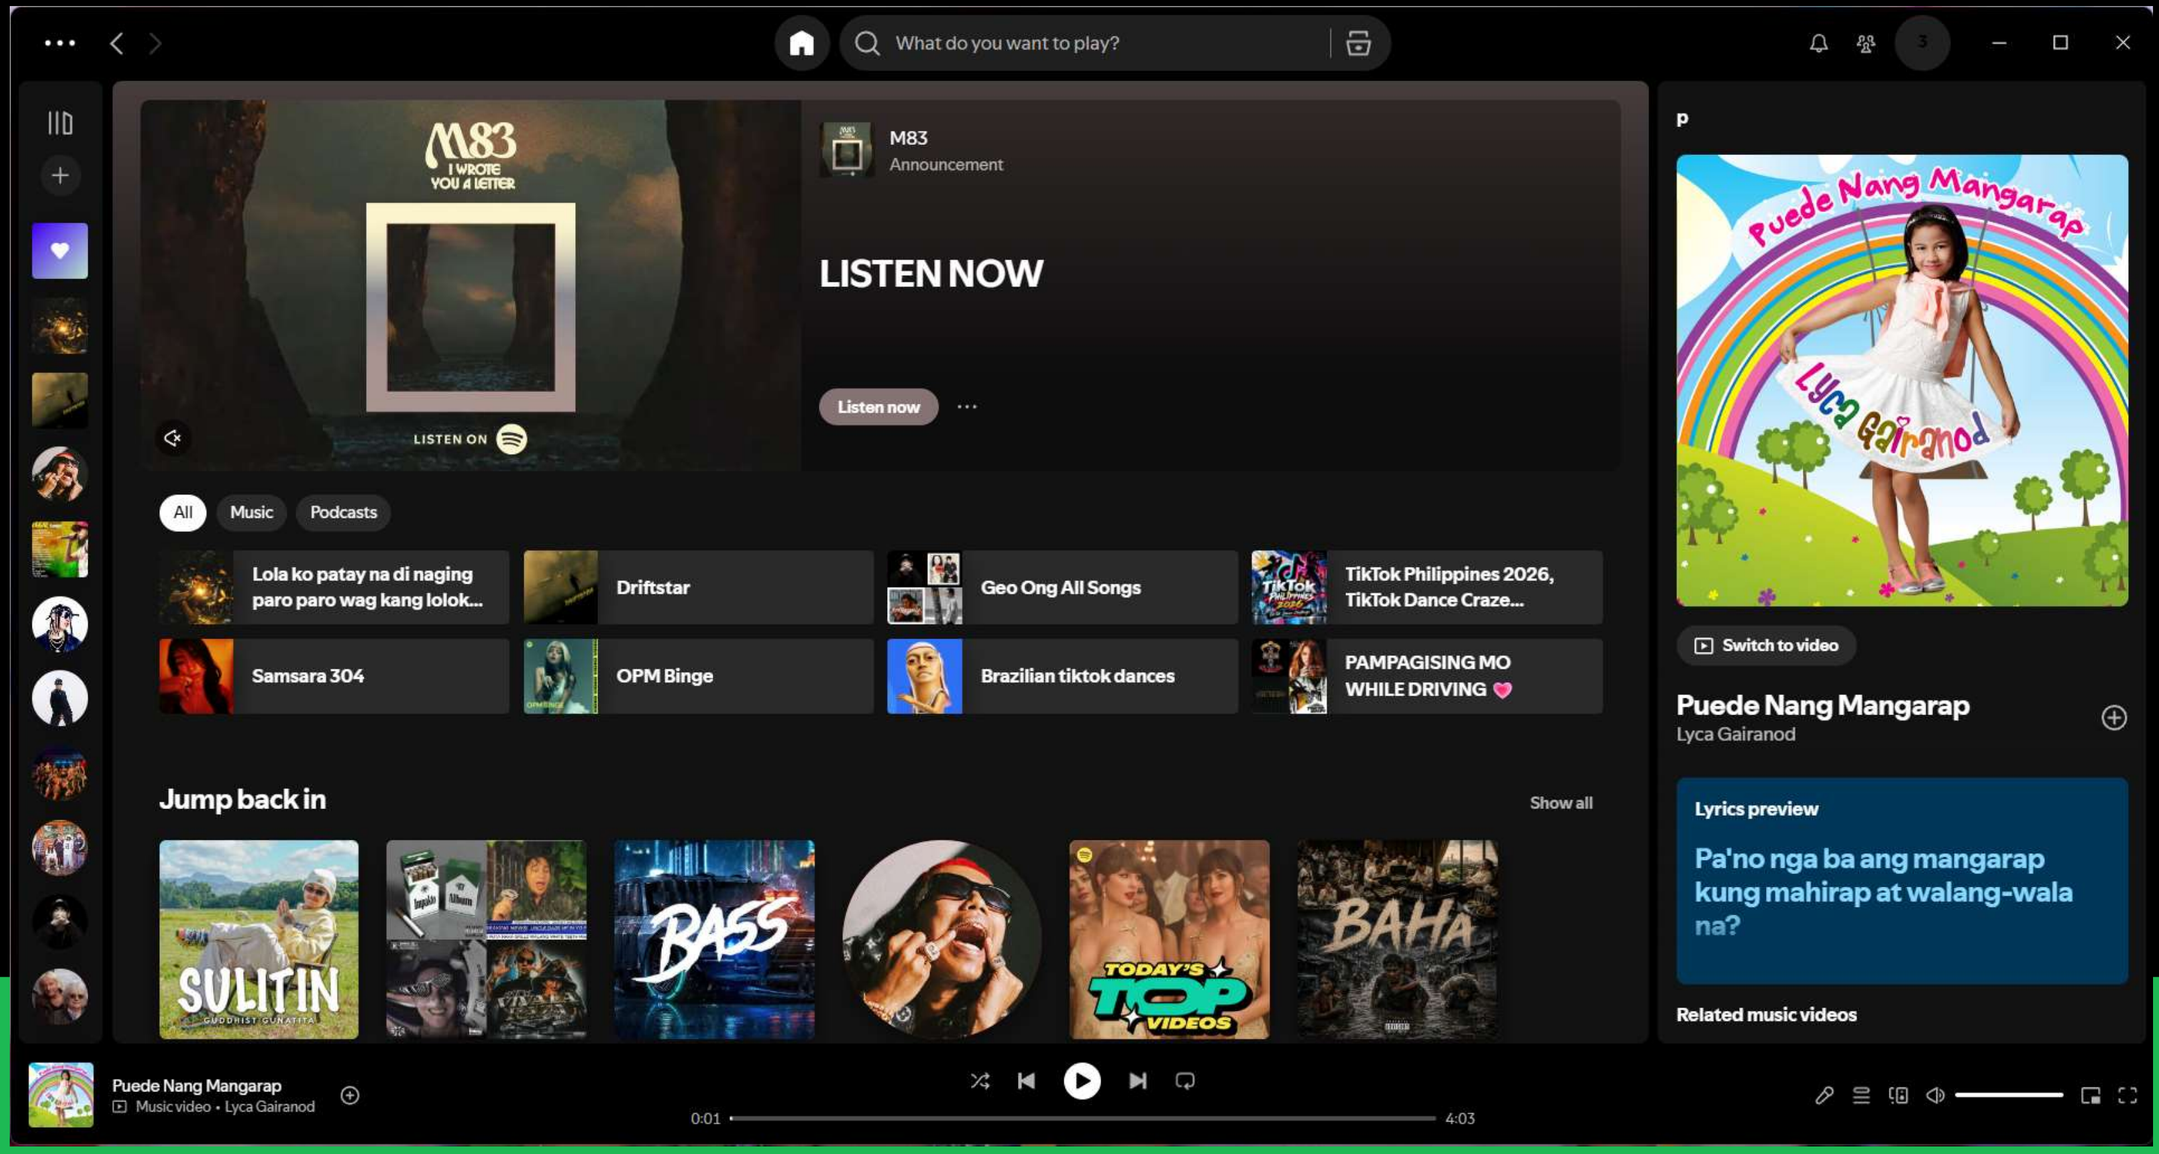

- What on the home screen bothers you the most? It's follow up question if they answer Yes in Q2.
- What one change would make the home screen easier to use? It's follow up question if they answer Yes in Q3.

G. Suggest what you would do differently next time.

Next time, we would include more respondents outside our group so we can get different opinions about Spotify. We would also focus our questions more on the four problems we identified:

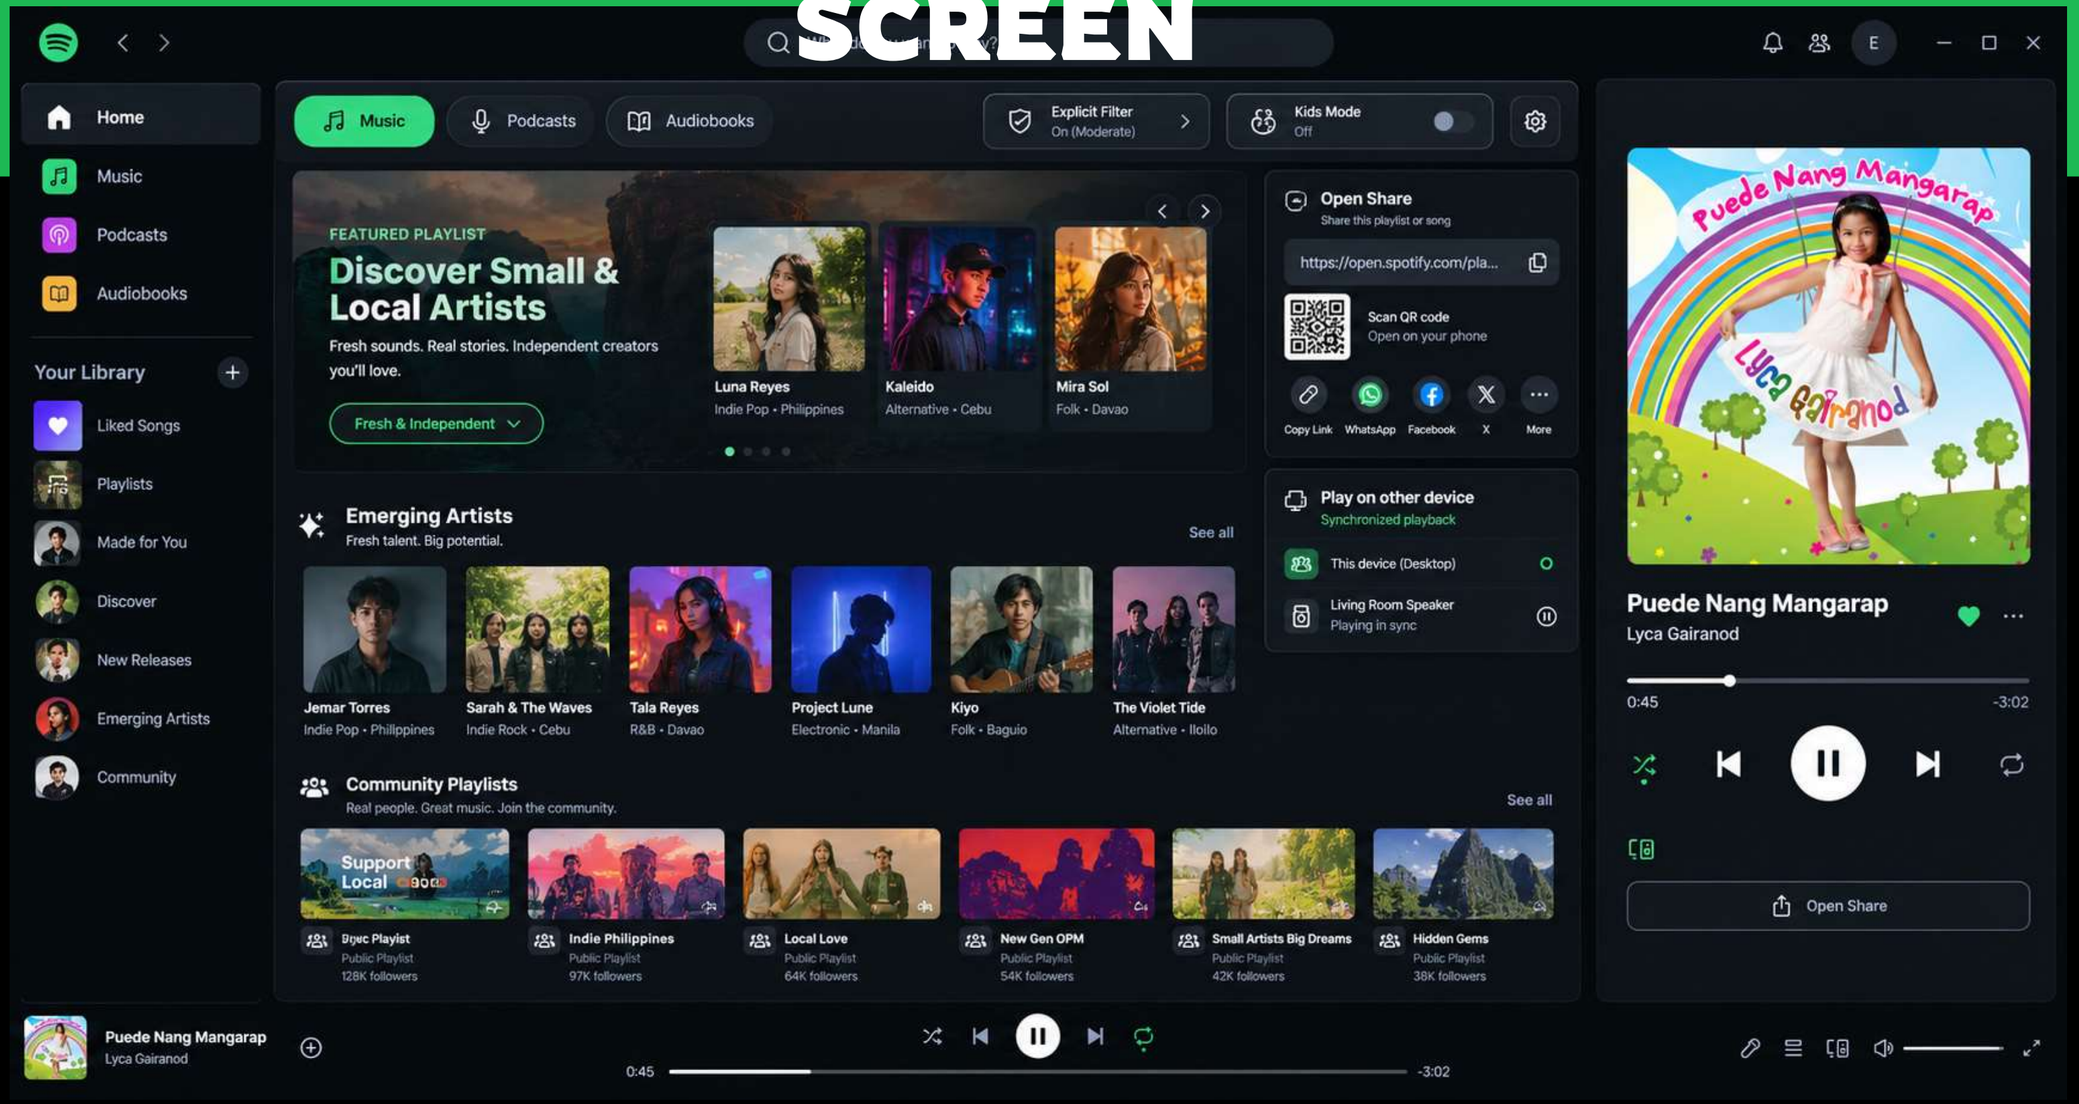

- Limited sharing of music and playlists
- Small artists are harder to discover
- No separate kids or NSFW mode
- Music, podcasts, and audiobooks are mixed together

We would also observe more Spotify users to see which of these problems they experience most. This would help us understand the users better and decide what parts of Spotify should be improved.
