Introduction

In today's homes, convenience and efficiency has become essential in everyday living. Yet many households still rely on multiple remote controls to operate different appliances, creating unnecessary clutter and confusion. Which inspired us to develop a smart and convenient solution.

Our 2 in 1 smart remote control is designed to simplify the way users interact with their home appliances by combining the control of both an air conditioner and an electric fan into a single, modern device. Built with a user-centered approach, it enhances convenience while reducing the need for multiple remotes, making everyday operation more organized and efficient. Providing a seamless and enjoyable user experience through practical, accessible, and smart technology

REMOTE DESIGN

The 2-in-1 Smart Remote Control is designed with simplicity, functionality, and ease of use as its main priorities. Instead of filling the remote with numerous physical buttons, the design features a minimal number of essential buttons along with a digital display that provides an interactive and organized interface.

The remote remote has a 2 separate physical buttons that lets the user choose what to use either the air conditioner or the electric fan. Once a selection is made, the display automatically shows only the controls relevant to that appliance. This adaptive interface creates a cleaner layout, minimizes confusion, and allows users to navigate the remote more efficiently.

How it works?

WIFI

Wi-Fi enables the remote control to communicate with smart appliances through a wireless network. Once connected to the same Wi-Fi network, users can control compatible air conditioners and fans without needing to point the remote directly at the device. This connection provides a longer operating range and supports seamless integration with smart home systems.

INFRARED

Infrared (IR) technology allows the remote control to communicate with air conditioners and electric fans by transmitting infrared light signals. To operate the appliance, the remote must be pointed directly at the device's IR receiver. This is a reliable, cost-effective, and widely used technology found in most household remote controls, making it compatible with many existing appliances without requiring an internet connection.
